

How does Lipocontrol™ work?

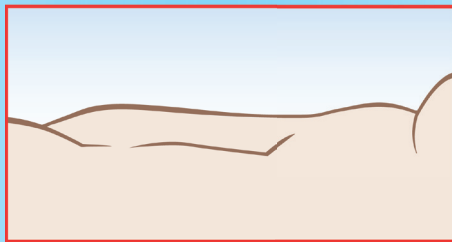

Your doctor administers a mild numbing agent to the targeted zone. Then a small metal tube called a cannula is inserted under the skin and a tiny laser beam is fired as the doctor moves the cannula back and forth. As the laser warms the fat cells, it creates a thermal effect. Fat cells, which are highly receptive to thermal energy, are liquefied and removed permanently.

Accumulated fat cells.

Lipocontrol™ liquefies fat cells.

Shapelier, smoother body.

Is Lipocontrol™ safe?

Yes. The U.S. Food and Drug Administration (FDA) has approved Lipocontrol™ for laser-assisted lipolysis. The on-board GPS technology allows your physician to safely control the application of the laser energy and continuously monitor the treatment area.

Throughout history, heat has been used to promote health and well being. Lipocontrol™ is a revolutionary technique that harnesses the power of heat-generating lasers, coupled with the precision of GPS tracking technology, to selectively break up unwanted body fat and reshape your body.

The latest technology for reshaping your body

Lipocontrol™ is a revolutionary approach that uses thermal energy and the latest technology to help you achieve the body you desire. If you are considering a cosmetic procedure, you owe it to yourself to talk to your doctor about Lipocontrol™ – the latest body shaping development from Europe.
